<–131 dBc/Hz (typ.) @1 GHz, 20-kHz offset, CW
**<–125 dBc/Hz (typ.)** @2 GHz, 20-kHz offset, CW

SSB phase noise is an important performance index for signal generators. For example, when using a signal generator for the following purposes, it is important to pre-confirm that the signal generator performance satisfies the measurement specifications.

• Communications with narrow bandwidth of several kHz
• CW interference waveforms
• Full range of reference and local signals

These options expand the MG3740A RF output upper limit. They are used when compensating for level losses of parts in the measurement path.
Supports Rubidium Reference Oscillator (Option)

Three reference oscillator options are supported. Select the high-stability reference oscillator option [Opt. 002] when requiring high accuracy depending on the measurement conditions; for even higher accuracy, select the rubidium reference oscillator [Opt. 001]. However, if external high-accuracy reference signals are available, selecting the standard reference oscillator option helps reduce unnecessary costs.

Reference Signal Generator for Evaluating Characteristics of Amplifiers, Mixers, etc.
Setup for evaluating intermodulation characteristics of amplifier
Setup for evaluating distortion characteristics of Mixer

The dual RF outputs of the MG3740A are ideal for evaluating intermodulation (IM3) characteristics of amplifiers, etc., as well as for use as RF/LO signal sources for testing mixers, eliminating the need for two separates signal generators. The high-performance MS269xA Signal Analyzer series is recommended for intermodulation and harmonic wave distortion measurements.

● Supports Maximum Two RF Outputs

Usually, two general signal generators are required to output two continuous waveforms when evaluating the intermodulation characteristics of amplifiers, etc., or for use as RF/LO signal sources at mixer tests. A maximum of two RF outputs (1stRF/2ndRF) can be installed in the MG3740A and the product lineup includes models with different 1stRF and 2ndRF frequencies. Different frequencies and levels can be set at the two signal outputs and the frequency/level synchronization function cuts the setting workload too.

● USB Power Sensor

Up to two USB power sensors (separately sold) can be connected to the MG3740A.

● High-power Output Option (Opt. 041/071) Supports CW Levels of +23 dBm

In general, an external amp is required when the output of a signal generator is insufficient, such as covering the measurement system transmission path loss and inputting high-level modulation signals for amp distortion characteristics tests. Since the output of an external amp cannot be assured, it must be checked with a power meter each time the frequency and level are changed. Moreover, when using an external amp, sometimes the DUT may be damaged by mishandling errors. The MG3740A high-power output supports signals required for measuring path loss. In addition, stable measurement is assured when used within the guaranteed setting range. And the risk of mistakenly damaging the DUT is reduced, even at the output limit.

Expansion to Digital Modulation Signal Generator

The MG3740A Analog Signal Generator can be expanded to add digital modulation generation functions, supporting evaluation of digital public safety radio systems.
All-in-one support for both analog and digital tests maximizes equipment investment efficiency.

Digital Modulation [Opt. 020]

Adding the digital modulation option [Opt. 020] supports generation of digital modulation signals by outputting narrowband digital modulation signals.
 Digital Modulation Performance
  • RF Modulation Bandwidth : 2 MHz
  • Sampling Rate : 20 kHz to 8 MHz

Dual Waveform Memory:
   Four Waveform Outputs Max.

In the standard configuration, one RF (1stRF or 2ndRF) has one waveform memory. However, adding the baseband signal combine option (Opt. 048/078) upgrades to two memories for one RF.
In other words, models with two RFs (1stRF and 2ndRF) installed can have a maximum of four waveform memories. Two waveform patterns can be set easily on-screen for one RF, each with different frequency offset, level offset and delay time settings to output a combined baseband RF signal. With this setup, one MG3740A supports the following test environment — a setup that previously required two signal generators:

    Wanted Signal + Interference Signal
    Wanted Signal + Delayed Signal

Software: IQproducer License

IQproducer is PC application software for generating waveform
patterns. The parameters are set using IQproducer and the
waveform pattern is created to output the signal by selection at the
MG3740A. This one software application includes all the following
systems.
Since it runs on any PC, the supported functions and parameter
range can be verified before purchase.
When outputting a waveform pattern from the MG3740A, no signal
is output unless a license for that system is installed in the main
frame.

∗: Requires MG3740A-020/120.

∗ Refer to the "IQproducer catalog" for details.
